Neonatal Wilms Tumor

By Michael L. Ritchey, Richard G. Azizkhan, J. Bruce Beckwith, Ellen E. Hrabovsky, and Gerald M. Haase
Houston, Texas

● Neonatal renal tumors are very rare. We have identified 15 cases of Wilms' tumors diagnosed in the first 30 days of life. The most common presentation was an abdominal mass on routine newborn examination, and three tumors were noted on an antenatal ultrasound. All of the infants underwent primary excision of the tumor. Five infants were not given postoperative chemotherapy after surgical excision.

Group, and review of the files at the National Wilms Tumor Study (NWTs) Data and Statistical Center and the NWTs Pathology Center. Reasons for exclusion from this study were diagnosis of the tumor after 30 days of age and pathological diagnosis other than Wilms tumor. This included three neonates with rhabdoid tumor of the kidney, which has a different clinical behavior and outcome from Wilms tumor.⁷ All three of the infants with rhabdoid tumors of progressive disease. Children with congenital mesoblastic nephroma were also excluded.

The patient records maintained at the NWTs Data and Statistical
